AB	The wiping cloths are prep'd. by heat-treating fabrics comprising ultrafine fibers (A) with denier per filament .1toreq.0.1 and filament yarns with heat shrinkage greater than the shrinkage of A fibers and treating the surface of the fabrics with a water jet to form wiping cloths essentially contg. no hydrophilic substances or elec. conductive substances. A knit comprising fibers consisting of PET as islands and a copolyester (I) contg. terephthalic acid units and Na 5-sulfoisophthalate units as the sea and having boiling water shrinkage 5.8% and polyester fibers with heat shrinkage 13.8% was prep'd., heat-treated 20 min at 130.degree., treated with an aq. soln. contg. 1% NaOH to dissolve I, sprayed with a water jet at 80 kg/cm ² , and heat-set at 130.degree. to give a chamois-like wiping cloth with hydrophilic substance content 0% and exhibiting evolution (JIS B-9923; shaking method) of dust particles with diam. 5.0 .mu.m 3/ft ² -100 cm ² and H ₂ O absorption (JIS L-1096) 286% and showing good handle and wiping properties.

PRAI	US 1981-260709		19810505		
AB	An opaque jacket for a magnetic recording diskette comprises a biaxially oriented polyester film contg. discrete, uniformly distributed polymer particles having an av. diam. of 5-100 .mu. and comprising 5-30% by vol. of the polyester film to provide a mat finish on the exterior face of the film, an adhesive layer preferably filled with conductive carbon black covering the inner face of the film, and a wiping fabric bonded by the adhesive layer to the inner face of the film. Thus, a blend of poly(ethylene terephthalate) [25038-59-9] 84.9, polypropylene [9003-07-0] particles (40 .mu.) 14.8, and carbon black pigment 0.3% was extruded and cast to provide a pigmented polyester film which was 1st continuously oriented over hot rolls 2.5 times in the machine direction at 100.degree., then 3.5 times transversely at 100.degree., and then heat-set at 200.degree. to give a biaxially oriented polyester film having a thickness of .apprx.200 .mu. and a mat finish (glass value 64). Mineral oil blotted onto the film changed the glass value only to 68, so oily smudges, e.g. fingerprints, should not be an aesthetic problem. The film was coated on 1 face with an aq. acrylic-vinyl adhesive, and random-cut cotton flock was electrostatically attracted to and embedded in the adhesive. A magnetic recording disk was sealed in a jacket prep'd. from the film.
